Guidance for Use Case Template

Document each use case using the template shown in the Appendix. This section provides a description of each section in the use case template.

1. Use Case Identification

1.1. Use Case ID

Give each use case a unique numeric identifier, in hierarchical form: X.Y. Related use cases can be grouped in the hierarchy. Functional requirements can be traced back to a labeled use case.

1.2. Use Case Name

State a concise, results-oriented name for the use case. These reflect the tasks the user needs to be able to accomplish using the system. Include an action verb and a noun. Some examples:

- View part number information.
- Manually mark hypertext source and establish link to target.
- Place an order for a CD with the updated software version.

1.3. Use Case History

1.3.1. Created By

Supply the name of the person who initially documented this use case.

1.3.2. Date Created

Enter the date on which the use case was initially documented.

1.3.3. Last Updated By

Supply the name of the person who performed the most recent update to the use case description.

1.3.4. Date Last Updated

Enter the date on which the use case was most recently updated.

2. Use Case Definition

2.1. Actor

An actor is a person or other entity external to the software system being specified who interacts with the system and performs use cases to accomplish tasks. Different actors often correspond to different user classes, or roles, identified from the customer community that will use the product. Name the actor(s) that will be performing this use case.

2.2. Description

Provide a brief description of the reason for and outcome of this use case, or a high-level description of the sequence of actions and the outcome of executing the use case.

2.3. Preconditions

List any activities that must take place, or any conditions that must be true, before the use case can be started. Number each precondition. Examples:

1. User's identity has been authenticated.
2. User's computer has sufficient free memory available to launch task.

2.4. Postconditions

Describe the state of the system at the conclusion of the use case execution. Number each postcondition. Examples:

1. Document contains only valid SGML tags.
2. Price of item in database has been updated with new value.

2.5. Priority

Indicate the relative priority of implementing the functionality required to allow this use case to be executed. The priority scheme used must be the same as that used in the software requirements specification.

2.6. Frequency of Use

Estimate the number of times this use case will be performed by the actors per some appropriate unit of time.

2.7. Flow of Events

Provide a detailed description of the user actions and system responses that will take place during execution of the use case under normal, expected conditions. This dialog sequence will ultimately lead to accomplishing the goal stated in the use case name and description. This description may be written as an answer to the hypothetical question, "How do I <accomplish the task stated in the use case name>?" This is best done as a numbered list of actions performed by the actor, alternating with responses provided by the system.

2.8. Alternative Flows

Document other, legitimate usage scenarios that can take place within this use case separately in this section. State the alternative course, and describe any differences in the sequence of steps that take place. Number each alternative course using the Use Case ID as a prefix, followed by "AC" to indicate "Alternative Course". Example: X.Y.AC.1.

2.9. Exceptions

Describe any anticipated error conditions that could occur during execution of the use case, and define how the system is to respond to those conditions. Also, describe how the system is to respond if the use case execution fails for some unanticipated reason. Number each exception using the Use Case ID as a prefix, followed by "EX" to indicate "Exception". Example: X.Y.EX.1.

2.10. Includes

List any other use cases that are included ("called") by this use case. Common functionality that appears in multiple use cases can be split out into a separate use case that is included by the ones that need that common functionality.

2.11. Special Requirements

Identify any additional requirements, such as nonfunctional requirements, for the use case that may need to be addressed during design or implementation. These may include performance requirements or other quality attributes.

2.12. Assumptions

List any assumptions that were made in the analysis that led to accepting this use case into the product description and writing the use case description.

2.13. Notes and Issues

List any additional comments about this use case or any remaining open issues or TBDs (To Be Determineds) that must be resolved. Identify who will resolve each issue, the due date, and what the resolution ultimately is.

Use Case Template

Use Case ID:	UC.5		
Use Case Name:	Analyse resume		
Created By:	Gan Sui	Last Updated By:	Gan Sui
Date Created:	29/3/26	Date Last Updated:	6/4/26

Actor:	Authenticated User
Description:	This use case allows the system to analyse the user's resume, extract relevant skills, and generate a resume score out of 100 based on defined evaluation criteria. The system evaluates the resume using either AI-based analysis through Ollama by DeepSeek or a fallback rule-based analysis. The final output includes the analysis mode used, an overall score, a breakdown of Impact, Competencies, and Presentation, extracted skill categories, and improvement suggestions.
Preconditions:	1. The user has uploaded a resume. 2. The user is authenticated. 3. The resume is available in a readable format for analysis.
Postconditions:	1. The system displays a resume score out of 100. 2. The system displays whether the analysis mode used is "AI-Enhanced" or "Standard Analysis". 3. The system displays a breakdown of scores for Impact, Competencies, and Presentation. 4. The system displays skill categories extracted from the resume. 5. The system displays scores for each category based on a rubric that counts keywords.
Priority:	High
Frequency of Use:	Medium

Flow of Events:	1. The Authenticated User selects the option to analyse the uploaded resume. 2. The system validates that a resume is available and begins the analysis process. 3. The Authenticated User waits for the analysis result. 4. The system extracts the resume content, identifies sections, and detects skills, bullet points, action verbs, and measurable achievements. 5. The Authenticated User receives the analysis mode indicator. 6. The system determines whether Ollama by DeepSeek is available for analysis. 7. If Ollama by DeepSeek is available, the system labels the result as “AI-Enhanced” and performs contextual resume analysis. 8. If Ollama by DeepSeek is unavailable, the system labels the result as “Standard Analysis” and performs rule-based analysis instead. 9. The Authenticated User views the generated scoring breakdown. 10. The system calculates and displays the overall resume score out of 100 together with the score breakdown for Impact, Competencies, and Presentation. 11. The Authenticated User reviews the extracted skills and feedback. 12. The system displays extracted skill categories, strengths, weaknesses, and displays scores for each category based on a rubric that counts keywords
-----------------	---

Alternative Flows:	UC.5.AC.1: AI is unavailable 1. The system detects that Ollama by DeepSeek is unavailable. 2. The system switches to rule-based analysis. 3. The system clearly labels the analysis mode as “Standard Analysis”. 4. The system continues and displays the analysis result. UC.5.AC.2: Resume contains limited measurable content 1. The system detects that the resume contains few action verbs or quantified achievements. 2. The system assigns a lower Impact score. 3. The system displays suggestions to include stronger action verbs and more measurable outcomes
Exceptions:	UC.5.EX.1: Analysis failure 1. The system encounters an error during analysis. 2. The system displays an error message and allows the user to retry.
Includes:	None
Special Requirements:	1. The system must use Ollama by DeepSeek when available for AI-based analysis. 2. Under “Standard Analysis”, the system must evaluate the resume using rule-based checks such as the number of action verbs, measurable achievements, quantified outcomes, and relevant competency keywords.
Assumptions:	1. “Standard Analysis” estimates Impact partly from the number of action verbs and quantifiable information found in the resume.
Notes and Issues:	1. AI evaluation consistency may vary across resumes. 2. Rule-based analysis may be less context-aware than AI-based analysis.
